

# The Pleasure Of Sport

Natural development through games and sports gives a deep feeling of accomplishment. No matter what the age or degree of fitness - physical activity adds value to life.

## SHOCK ABSORPTION

The patented Boflex Sports Floor System, with built-in shock absorption in the parquet, is as well suited for children's activities as it is for withstanding

More and more of such activity takes place indoors. This means that nearly every fitness center, school, or recreation center has some form of sports facility or a place where it is possible to engage in games, sport or play. Sports venues are found in differing sizes and standards with a wide variety of equipment and facilities. But there is one thing they have in common and that is that they all have a floor.

The floor is the most important part of any sporting facility - everything is focused on or around the floor. This is why the choice of floor is so important. This choice isn't easy - everyone wishes to emphasize the activity in which they are personally most interested. The question is whether there is a sports floor that suits all the various activities?

12 years ago, Centaur introduced Boflex to America. Over the 12 years, several hundred Boflex floors have been installed. Right from the beginning, we have received positive feedback from sports persons, recreation directors, and aerobic participants. When it comes to hardwood sports floors, nothing beats Boflex!

the weight of a heavy grandstand. The Evazote material used for shock absorption is a cross-linked, closed cell system. The shock-absorption material can only be compressed to a maximum of 50% - this means that a Boflex floor can never be over loaded. The floor can withstand several tons of pressure without any damage being done.

## SURFACE

Boflex has developed an advanced method of planning, which in contrast to other manufacturers of pre-finished hardwood flooring, mills the tongue and groove after lacquering. Each board then acquires a sharp edge and the floor, when laid, does not have visible joints.

During production, the Boflex Sports Floor is given 6 coats of UV hardened lacquer. These are made up of an impregnating layer, a layer of pore filling primer, 2 coats of strong primer, and 2 layers of topcoat. Boflex isn't just beautiful to look at, it is also economical!

## RENOVATION

Due to its extremely low profile (1 1/8 inches) it is well suited for renovation purposes. The patented system works very well when installed on old sports flooring, whether it be point or surface elastic.
